

justPipe

ABOUT

justPipe is fast, accurate and user friendly software developed to help with pipes and cables digitizing during subsea inspection or construction survey support

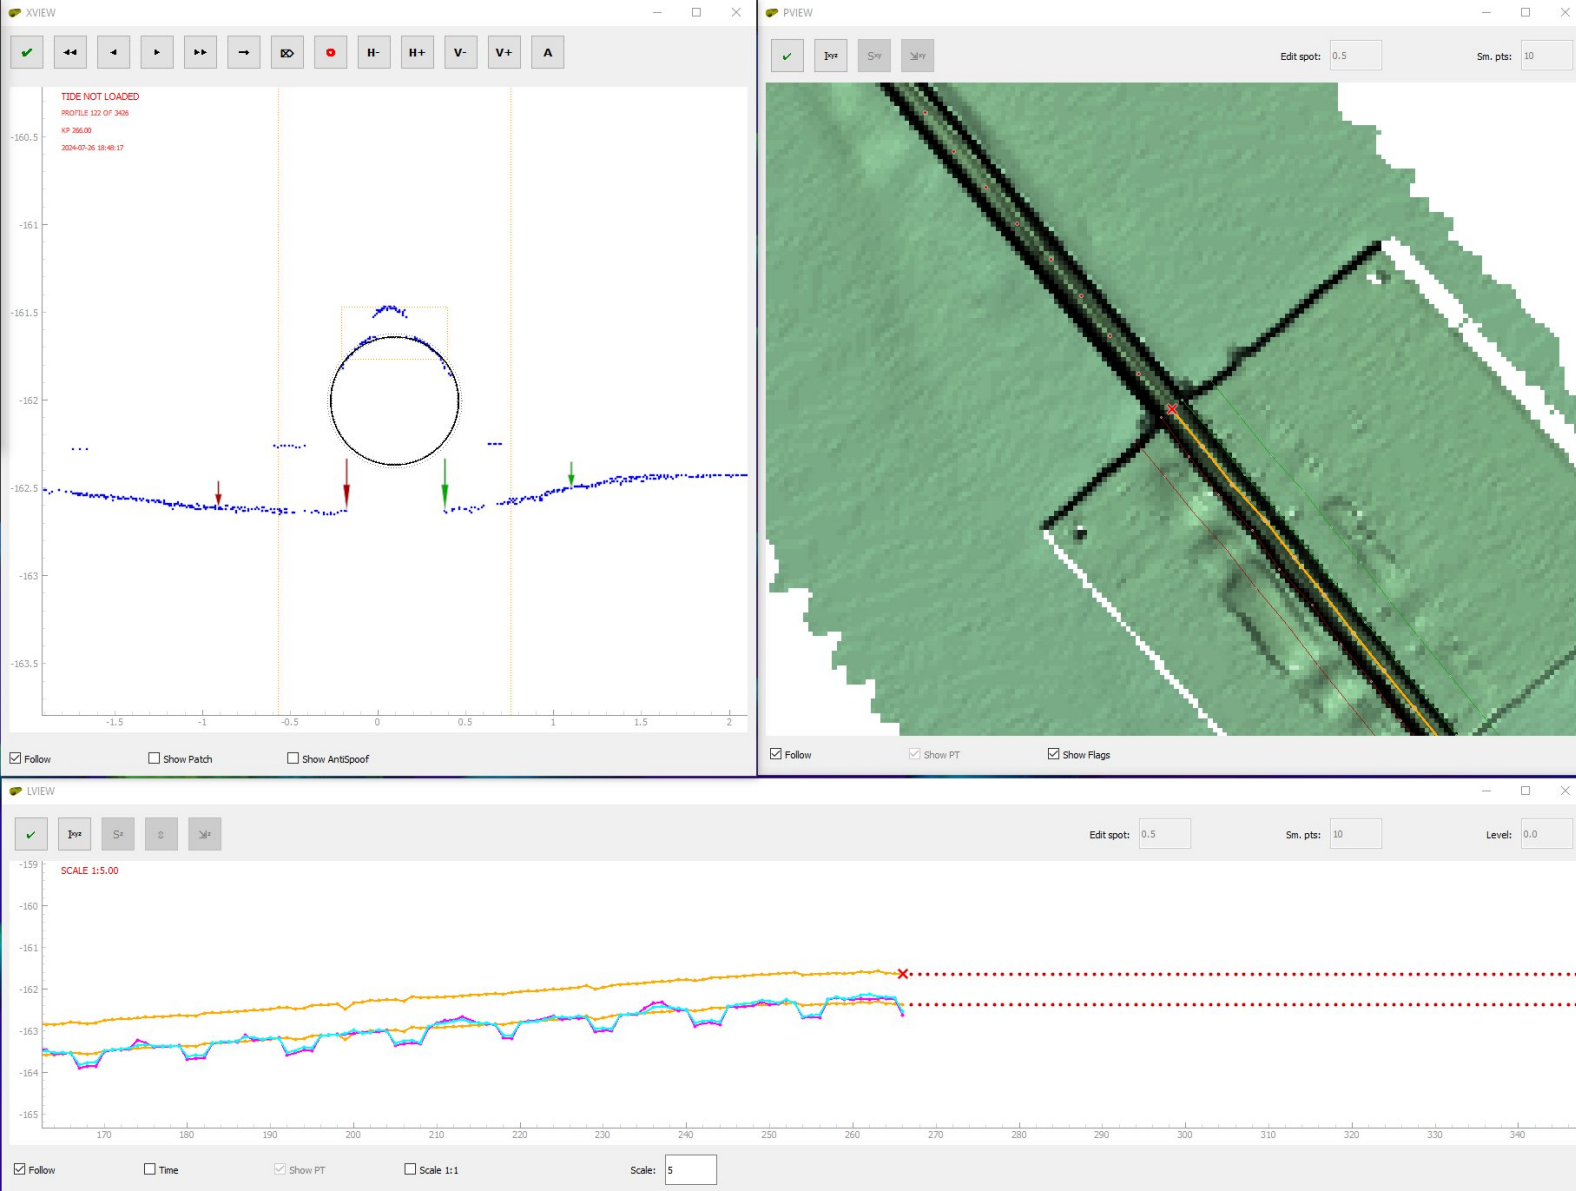

It may be used both offshore and in the office as stand-alone tool or in addition to other industry software like EIVA or Starfix

CAPABILITIES

- Product top placement*
- Adjacent and mean seabed markers placement*
- Pipetracker data processing (acception/rejection, smoothing, leveling)*
- Digital video support*
- Export to industry software formats (presently EIVA and Stafix)*

ADVANTAGES

- Processing strategy combining automation of digitizing and QC in one pass*
- Fast, reliable and accurate algorithms of top and markers placement*
- Intuitive and ergonomic user interface for on-the-fly parameters adjustment following data conditions*
- May be used as addition to main processing software without obtaining additional license*

HOW IT WORKS

***justPipe** requires usual set of survey data like cross-profiles and pipetracker. Tide may be applied or unapplied at any stage. The required profile data may be obtained from other industry software.*

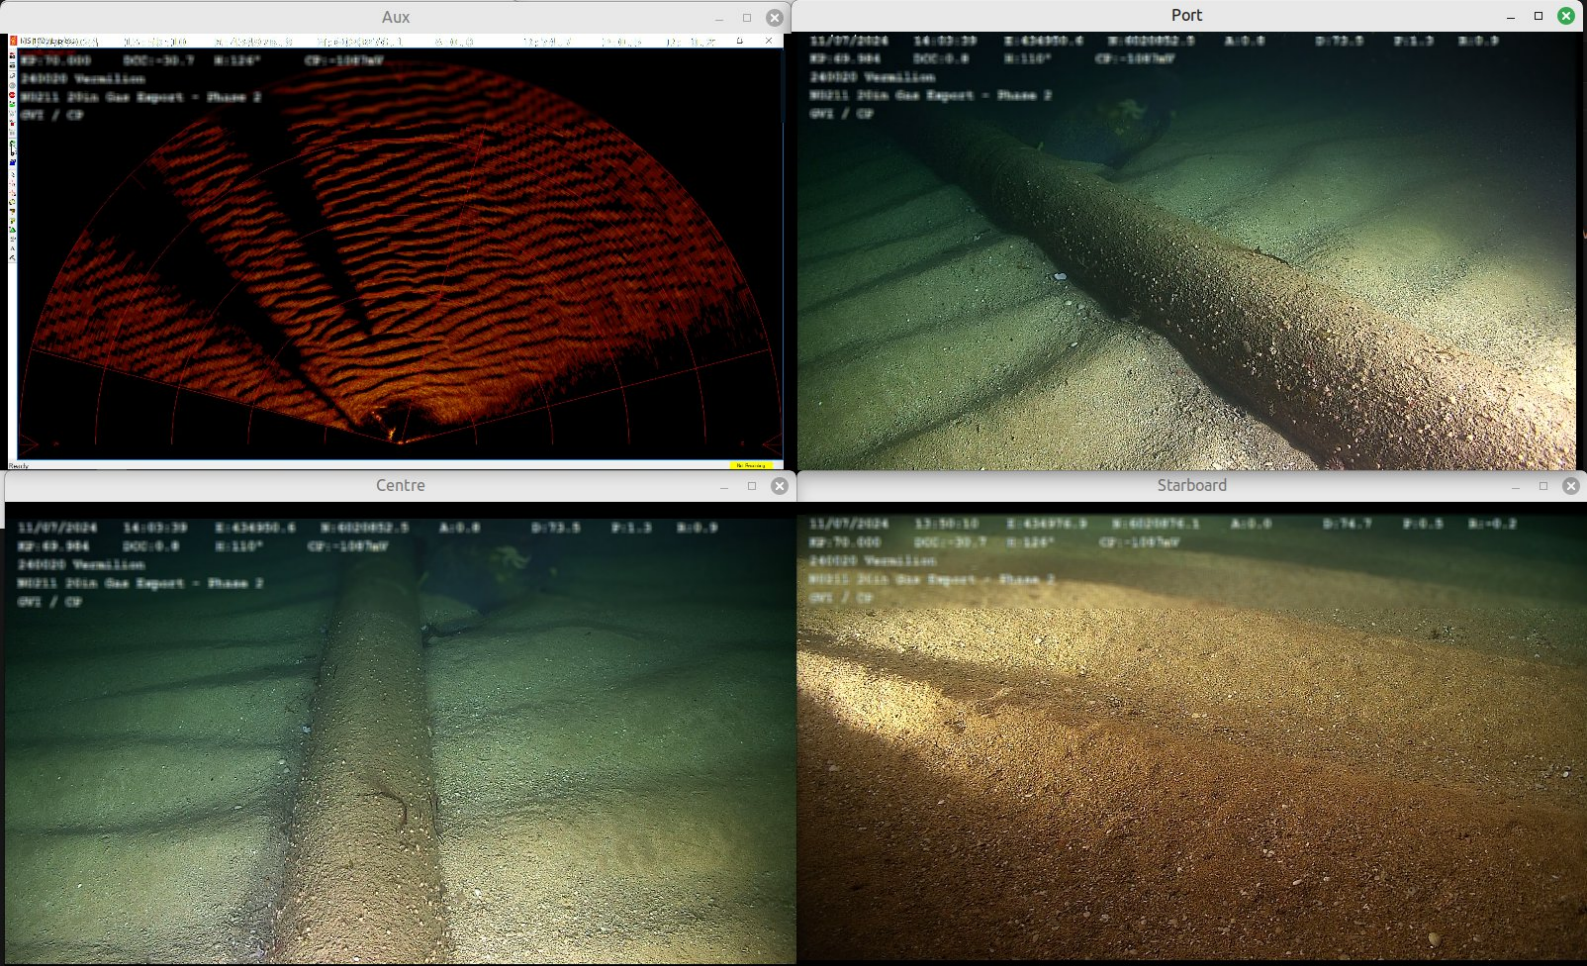

Software automatically places product top and seabed markers as it goes forward. Processor may correct misplaced flags literally in 'one click'. Various flexible assisting tools are available. It is important that seabed markers are automatically re-placed based on new top position. This apparently saves processing time compared to many other processing tools.

Adaptive seabed markers placement mode is another advantage. This allows for relevant placement adjacent markers in spanning/buried parts to indicate appropriate span height and burial depth.

Processor is enabled to adjust processing parameters on-the-fly to follow changing product or data conditions. This does not require re-processing.

Pipetracker data may be reviewed and edited as relevant. Product top may be snapped to pipetracker either in horizontal/vertical planes or both.

For minor product visibility gaps due to intervention structures like mattresses, rockbags, etc., interpolation may be used.

MEDIA SUPPORT

Digital video, and georeferenced images may be loaded to assist with product visualization. Camera offset and time difference may be specified.

REQUIREMENTS

justPipe software presently may run on Windows and Linux. Additional video codecs may need to be installed.
